

For these questions, use the simulation “Density matrices for a two-level spin system” and work through the simulation, including the step-by-step exploration (click on the “Step-by-step Exploration” tab).

1) Calculate the density matrix ρ and its square ρ^2 explicitly for the following situations shown in the simulation:

- a) an equal mixture of particles in eigenstates $|z_+ \rangle$ and $|z_- \rangle$
- b) particles in the eigenstate $|x_+ \rangle$
- c) particles in the eigenstate $|x_- \rangle$
- d) an equal mixture of particles in eigenstates $|x_+ \rangle$ and $|x_- \rangle$.

Which of the states described in a) to d) are pure states, which are mixed states, which are superposition states with respect to the basis $|z_+ \rangle$ and $|z_- \rangle$? Verify your answers by determining the traces $Tr(\rho)$ and $Tr(\rho^2)$.

2) Imagine the Stern-Gerlach Apparatus shown in the simulation were oriented at an angle θ to the z-axis, in the xz plane. After passing through the SGA, the beam deflected in the positive θ direction consists of particles in the eigenstate $|\theta_+ \rangle = \cos(\theta/2) |z_+ \rangle + \sin(\theta/2) |z_- \rangle$.

- a) Interpret this formula for $|\theta_+ \rangle$ for the special cases $\theta = 0^\circ$ and $\theta = 90^\circ$ shown in the simulation.
- b) Determine the density matrix for the state $|\theta_+ \rangle$.
