School of Physics & Astronomy

Head of School
Professor S L Lee

Degree Programmes

Graduate Diploma: Photonics and Optoelectronic Devices
Physics

M.Sc.: Photonics and Optoelectronic Devices
Physics

Eng.D.: Photonics

Programme Requirements

Photonics and Optoelectronic Devices
http://www.st-andrews.ac.uk/physics/msc

The primary aim of this one-year, full-time course is to provide specialist postgraduate training in modern optics and semiconductor physics, tailored to the needs of the Photonics industrial sector. The secondary aim is to provide the education required for those wishing to continue in academia on Ph.D. research projects in photonics.

Graduates from the course will have gained an in-depth understanding of the fundamental properties of optoelectronic materials and practical experience of the technology and operation of a wide range of laser and semiconductor devices. They will additionally have had experience of research, usually in an industrial environment, and have received training in the transferable skills required in such an environment.

The course is organised jointly by the School of Physics and Astronomy at the University of St Andrews and the School of Engineering and Physical Sciences at Heriot-Watt University. Each organisation will act in turn as host for the course. In 2005-6 the course will be hosted by Heriot-Watt, and in 2006-07 by St Andrews. Regardless of which institution hosts the course, the first semester is spent at St Andrews, and the second semester at Heriot-Watt. A project is undertaken during the summer months, usually in industry, and is assessed in September.

The course is approved by the Engineering and Physical Sciences Research Council (E.P.S.R.C.) and a number of studentships (tuition fees and stipend) are available from an E.P.S.R.C. grant held by the course.

Graduate Diploma: PH5171 – PH5176
M.Sc.: PH5171 – PH5177 (http://www.st-andrews.ac.uk/physics/msc)

[The above modules are correct for when the students are hosted at St Andrews. When they are hosted at Heriot-Watt then the same material is covered, and the same module names are used, but Heriot-Watt module numbers are used.]

Photonics
http://www.photonics-engd.hw.ac.uk/

The Eng.D. degree in Photonics is a 4-year course involving a blend of specialist postgraduate training in all aspects of photonics, tailored to the needs of the photonics industrial sector, and a significant, challenging and original research project undertaken as a partnership between industry and academia. Each research project provides experience in project management (including financial management) and teamwork as well as the opportunity to gain greater understanding of photonics and the business context in which the research is conducted. A significant proportion of the student’s time (typically around 70%) is spent within the sponsoring company.

Graduates from the course will have gained an in-depth understanding of the fundamental properties of photonic materials and practical experience of the technology and operation of a wide range of photonic devices. They will additionally have had extensive experience of research in an industrial environment and have received training in the transferable skills required in such an environment.
The course is organised jointly by the School of Physics and Astronomy of the University of St Andrews, the School of Engineering and Physical Sciences at Heriot Watt University, and the Department of Electronics and Electrical Engineering at the University of Strathclyde. St Andrews will normally be the location for the start of the course and will provide full time teaching during the first semester of the first year of the course. When this initial semester is completed students move to their industrial location and begin their research. They also take during the next five semesters the balance of the taught component of the Eng.D. either by distance learning or via short courses offered by Heriot-Watt and St Andrews.

The course is approved by the Engineering and Physical Sciences Research Council (E.P.S.R.C.) and a number of EPSRC-funded studentships are available.

Eng.D. PH5201- PH5208 together with modules taught by Heriot Watt University and the University of Strathclyde

[NOTE PH5203, PH5206 and PH5207 are optional for this programme]

Physics

Graduate Diploma: A total of 120 credits from AS and PH modules at 4000 level and above, including at least 90 credits at 5000 level, the course of study to be approved by the Head of School.

MSc: 120 credits as for Graduate Diploma together with a dissertation (PH5301) comprising 3 months full-time study and worth 60 credits.

Modules

**AS5001 Astronomical Data Analysis**

Credits: 15.0  
Semester: 1  
Prerequisite: AS2001  
Description: This module develops an understanding of basic concepts and offers practical experience with the techniques of quantitative data analysis. Beginning with fundamental concepts of probability theory and random variables, practical techniques are developed for using quantitative observational data to answer questions and test hypotheses about models of the physical world. The methods are illustrated by applications to the analysis of time series, imaging, spectroscopy, and tomography datasets. Students develop their computer programming skills, acquire a data analysis toolkit, and gain practical experience by analyzing real datasets.

Class hour: To be arranged.  
Teaching: Three lectures or tutorials.  
Assessment: Continuous Assessment = 100%  

**AS5002 Star Formation and Plasma Astrophysics**

Credits: 15.0  
Semester: 2  
Prerequisite: AS2001  
Description: The aim is to describe the physics of how a magnetic field interacts with a plasma, and to use this knowledge to explore the role of magnetic fields in the formation of solar-like stars and in compact objects with accretion discs. The syllabus comprises: Solar-like magnetic activity on other stars. The basic equations of magneto-hydrodynamics. Stellar coronae: X-ray properties and energetics of coronal loops. Energetics of magnetic field configurations. MHD waves and propagation of information. Solar and stellar dynamos: mean field models. Star formation: properties of magnetic cloud cores, magnetic support. Physics of accretion discs: transport of mass and angular momentum. Accretion on to compact objects and protostars. Rotation and magnetic fields in protostellar discs. Rotation distributions of young solar-type stars. Magnetic braking via a hot, magnetically channelled stellar wind.

Class hour: To be arranged.  
Teaching: Three lectures or tutorials.  
Assessment: 2 Hour Examination = 100%
AS5003 Contemporary Astrophysics
Credits: 15.0 Semester: 1
Description: This module will provide an annual survey of the latest, most interesting, developments in astronomy and astrophysics at the research level. Emphasis will be placed upon the application of knowledge and expertise gained by students in their other modules to these current research topics.
Class Hour: To be arranged.
Teaching: 3 lectures and some tutorials
Assessment: 2 Hour Examination = 100%

PH5002 Foundations of Quantum Mechanics
Credits: 15.0 Semester: 1
Prerequisite: PH3061 and PH3062.
Description: This module consists of five parts: (i) Hilbert spaces and operators including a discussion of spectral decomposition of selfadjoint operators; (ii) postulates of quantum mechanics for observables with discrete spectra with illustrative examples including various pictures (Schrodinger, Heisenberg, interaction) of time evolution; (iii) postulates of quantum mechanics for observables with continuous spectra in terms of probability distribution functions and the spectral functions; (iv) quantum theory of orbital, spin angular momenta and their addition, Pauli-Schrodinger equation; (v) introduction to relativistic quantum mechanics.
Class Hour: To be arranged.
Teaching: Three lectures or tutorials.
Assessment: 2 Hour Examination = 100%

PH5003 Group Theory
Credits: 15.0 Semester: 1
Prerequisites: PH3061 and PH3062
Description: This module explores the concept of a group, including groups of coordinate transformations in three-dimensional Euclidean space; the invariance group of the Hamiltonian operator; the structure of groups: subgroups, classes, cosets, factor groups, isomorphisms and homomorphisms, direct product groups; introduction to Lie groups, including notions of connectness, compactness, and invariant integration; representation theory of groups, including similarity transformations, unitary representations, irreducible representations, characters, direct product representations, and the Wigner-Eckart theorem; applications to quantum mechanics, including calculation of energy eigenvalues and selection rules.
Class Hour: To be arranged.
Teaching: Three lectures or tutorials.
Assessment: 2 Hour Examination = 100%

PH5004 Quantum Field Theory
Credits: 15.0 Semester: 1
Prerequisite: PH3073 or MT4507, and PH5002.
Description: This module presents an introductory account of the ideas of quantum field theory and of simple applications thereof, including quantization of classical field theories, second quantization of bosons and fermions, the failure of single particle interpretation of relativistic quantum mechanics, solving simple models using second quantization, Feynman’s path integral approach to quantum mechanics and its relation to classical action principles, field integrals for bosons and fermions, the relationship between path integral methods and second quantization, and a descriptive introduction to Green’s functions and Feynman diagrams.
Class Hour: To be arranged.
Teaching: Three lectures or tutorials.
Assessment: 2 Hour Examination = 100%
PH5005 Laser Physics 2

Credits: 15.0  
Semester: 1  
Prerequisites: PH4034, PH3061, PH3062, PH3007 or (PH3064 and PH3065).  
Anti-requisite: PH5018  
Description: Quantitative treatment of laser physics embracing both classical and semiclassical approaches; transient/dynamic behaviour of laser oscillators including relaxation oscillations, amplitude and phase modulation, frequency switching, Q-switching, cavity dumping and mode locking; design analysis of optically-pumped solid state lasers; laser amplifiers including continuous-wave, pulsed and regenerative amplification; dispersion and gain in a laser oscillator - role of the macroscopic polarisation; unstable optical resonators, geometric and diffraction treatments; quantum mechanical description of the gain medium; coherent processes including Rabi oscillations; semiclassical treatment of the laser; tunable lasers.  
Class Hour: To be arranged.  
Teaching: Three lectures or tutorials.  
Assessment: 2 Hour Examination = 100%

PH5008 Optoelectronics and Nonlinear Optics 2

Credits: 15.0  
Semester: 2  
Prerequisite: PH4027  
Anti-requisite: PH5019  
Description: This module develops concepts introduced in PH4027 to a level at which the student should be able to understand state-of-the-art systems in these fields and to appreciate the research literature. In particular, the ideas of nonlinear optics are developed more quantitatively and in greater depth, and the module shows how such properties can be the basis of important devices. The field of optical communication is covered, include the modes of propagation in waveguides and the use of nonlinear effects in optical waveguides. Optoelectronic devices such as SEED are described, including their roles in optical switching.  
Class Hour: To be arranged.  
Teaching: Three lectures or tutorials.  
Assessment: 2 Hour Examination = 100%

PH5011 General Relativity

Credits: 15.0  
Semester: 2  
Description: This module covers: inertial frames, gravity, principle of equivalence, curvature of spacetime; basic techniques of tensor analysis; Riemannian spaces, metric tensor, raising and lowering of indices, Christoffel symbols, locally flat coordinates, covariant derivatives, geodesics, curvature tensor, Ricci tensor, Einstein tensor; fundamental postulates of general relativity: spacetime, geodesics, field equations, laws of physics in curved spacetime; distances, time intervals, speeds; reduction of equations of general relativity to Newtonian gravitational equations; Schwarzschild exterior solution, planetary motion, bending of light rays, time delays; observational tests of general relativity; Schwarzschild interior solution, gravitational collapse, black holes.  
Class Hour: To be arranged.  
Teaching: Three lectures or tutorials.  
Assessment: 2 Hour Examination = 100%

PH5012 Quantum Optics

Credits: 15.0  
Semester: 2  
Prerequisite: PH3061, PH3062  
Description: Quantum optics is the theory of light that unifies wave and particle optics. Quantum optics describes modern high-precision experiments that often probe the very fundamentals of quantum mechanics. The module introduces the quantisation of light, the concept of single light modes, the various quantum states of light and their description in phase space. The module considers the quantum effects of simple optical instruments and analyses two important fundamental experiments: quantum-state tomography and simultaneous measurements of position and momentum.  
Class Hour: To be arranged.  
Teaching: Three lectures or tutorials.  
Assessment: 2 Hour Examination = 100%
PH5013 Superconductivity

Credits: 15.0  Semester: 2
Availability: 2005-06
Prerequisites: PH3002, PH3061, PH3062

Description: This module will involve a treatment of one of the outstanding on-going problems in modern physics. The basic thermodynamics of the superconducting state will be reviewed, emphasising superconductivity as an archetypal second order phase transition. The next section will cover Ginzburg-Landau theory and the different phenomenological properties of type-I and type-II superconductors. An explanation will be given of the famous Bardeen-Cooper-Schrieffer theory of conventional superconductivity. Finally, a brief overview will be given of the many unsolved problems in modern unconventional superconductivity in materials as diverse as oxides, 'heavy fermion' alloys and allotropes of carbon. A few topics will be the subject of individual study by the student and will be examined continuously.

Class Hour: To be arranged.
Teaching: Two lectures and some tutorials.
Assessment: Continuous Assessment = 25%, 2 Hour Examination = 75%

PH5014 The Interacting Electron Problem in Solids

Credits: 15.0  Semester: 2
Availability: 2006-07
Prerequisites: PH3002, PH3061, PH3062

Description: The aim of this module is to give an overview of developments in modern condensed matter physics. The difficulties of a full quantum mechanical treatment of electrons with strong interactions will be discussed. Common existing approaches such as the Hubbard and t-J models and Fermi liquid theory will be compared. It will be shown that, although microscopic models can explain aspects of magnetism, they have little chance of capturing many other features of the fascinating low-energy physics of these systems. Instead, we introduce the principle of emergence, and show how it suggests radically new approaches to the problem of complexity in condensed matter physics and beyond. In this module, formal lectures will be combined with reading assignments, and the assessment will be based on marked homework together with an oral presentation followed by questions.

Class Hour: To be arranged.
Teaching: Two lectures and some tutorials.
Assessment: Continuous Assessment = 50%, Presentation plus Oral Examination = 50%

PH5015 Experimental Quantum Physics at the Limit

Credits: 15.0  Semester: 1
Availability: 2005-06
Prerequisites: PH3061, PH3062

Description: Quantum physics is one of the most powerful theories in physics yet is at odds with our understanding of reality. In this module we show how laboratories around the world can prepare single atomic particles, ensembles of atoms, light and solid state systems in appropriate quantum states and observe their behaviour. The module includes studies of Bose-Einstein condensation, quantum dots and quantum computing. An emphasis throughout will be on how such quantum systems may actually turn into practical devices in the future. The module will include one workshop and a short presentation on a research paper.

Class Hour: To be arranged.
Teaching: Two lectures and some tutorials.
Assessment: Continuous Assessment = 25%, 2 Hour Examination = 75%
PH5016 Biophotonics

Credits: 15.0  Semester: 1
Availability: 2006-07
Prerequisites: PH3005 or PH3010 or PH4034
Description: The module will expose students to the exciting opportunities offered by applying photonics methods and technology to biomedical sensing and detection. A rudimentary biological background will be provided where needed. Topics include fluorescence microscopy and assays including time-resolved applications, optical tweezers for cell sorting and DNA manipulation, photodynamic therapy, lab-on-a-chip concepts and bio-MEMS. Two thirds of the module will be taught as lectures, including guest lectures by specialists, with the remaining third consisting of problem-solving exercises, such as specific literature reviews, design exercises and mini-projects. A visit to a biomedical research laboratory, e.g. at Ninewells hospital, will also be arranged.

Class Hour: To be arranged.
Teaching: Two lectures and some tutorials.
Assessment: Continuous Assessment = 25%, 2 Hour Examination = 75%

PH5018 Extended Laser Physics 2

Credits: 20.0  Semester: 2
Availability: 2006-07
Prerequisites: PH3007, PH4034
Anti-requisite: PH5005
Description: This module consists of the material in PH5005 with the addition of a project involving directed reading on a related advanced topic.

Class Hour: To be arranged.
Teaching: Three lectures and some tutorials.
Assessment: Continuous Assessment = 25%, 2 Hour Examination = 75%

PH5019 Extended Optoelectronics and Nonlinear Optics 2

Credits: 20.0  Semester: 2
Availability: 2006-07
Prerequisite: PH4027
Anti-requisite: PH5008
Description: This module consists of the material of PH5008 with the addition of a project involving directed reading on a related advanced topic.

Class Hour: To be arranged.
Teaching: Three lectures and some tutorials.
Assessment: Continuous Assessment = 25%, 2 Hour Examination = 75%

PH5171 Lasers

Credits: 24.0  Semester: Whole Year
Programme(s): Compulsory module for Photonics and Optoelectronic Devices Postgraduate Taught Programme.

Description: This module presents a description of the main physical concepts upon which an understanding of laser materials, operations, and applications can be based. These concepts include a semi-classical treatment of light-matter interaction, gain, absorption and refractive index, rate-equation theory of lasers, gain and its saturation, frequency selection and tuning in lasers, transient phenomena, resonator and beam optics, and the principles and techniques of ultrashort pulse generation and measurement.

Class Hour: To be arranged.
Teaching: Three lectures each week and occasional tutorials.
Assessment: Examinations totalling 3 hours, spread over 2 semesters = 100%
PH5172 Modern Optics
Credits: 24.0  Semester: Whole Year
Programme(s): Compulsory module for Photonics and Optoelectronic Devices Postgraduate Taught Programme.
Description: The nonlinear optics section of this module describes the physical ideas and application of second and third order nonlinear optics, including phenomena such as harmonic generation, parametric gain, saturated absorption, nonlinear refraction, Raman scattering, and optical solitons. The modulator section looks at the electro-optic and acousto-optic effects and their use in optical modulators. The section on Fourier Optics and Holography includes diffraction theory, Fourier transforms in optics, spatial filtering, and holographic techniques. The section on photonic guiding explains how micro-structuring of materials can lead to designer light guides and emitters.
Class Hour: To be arranged.
Teaching: Three lectures each week and occasional tutorials.
Assessment: Examinations totalling 3 hours, spread over 2 semesters = 100%

PH5173 Photonic Materials
Credits: 12.0  Semester: Whole Year
Programme(s): Compulsory module for Photonics and Optoelectronic Devices Postgraduate Taught Programme.
Description: The physics of semiconductors is covered, including areas of particular importance in optoelectronics such as band theory, optical and electronic properties, mobility and diffusion, and low dimensional structures. The physics of polymers and liquid crystals is covered, showing the way to the use of semi-conducting polymers as light emitters, and the use of liquid crystals in displays and spatial light modulators. The section on materials growth and fabrication aims to give an overview of the science and technology involved in the growth of materials relevant in the photonics field.
Class Hour: To be arranged.
Teaching: Two lectures each week and occasional tutorials.
Assessment: Examinations totalling 2 hours, spread over 2 semesters = 100%

PH5174 Optoelectronic Devices
Credits: 24.0  Semester: Whole Year
Programme(s): Compulsory module for Photonics and Optoelectronic Devices Postgraduate Taught Programme.
Description: The main core of this module consists of sections on semiconductor devices and on telecommunications and optical fibres. Building on ideas developed in the module on Photonic materials, devices such as LEDs, VCSELs, optical amplifiers, and all-optical switches are examined in detail. The physics underpinning the design of optical fibre links is covered, including optical sources, amplifiers, detectors, coding schemes, and fibre sensors. The final sections of the course may change from year to year, and may include lectures on two of: optical informatics, lasers in medicine, terahertz technology, optical instrumentation and sensors, and optical packaging.
Class Hour: To be arranged.
Teaching: Three lectures each week and occasional tutorials.
Assessment: Examinations totalling 3 hours, spread over 2 semesters = 100%
PH5175 Technical Communication and Business Awareness

Credits: 24.0  
Semester: Whole Year  
Programme(s): Compulsory module for Photonics and Optoelectronic Devices Postgraduate Taught Programme.

Description: This module addresses issues of the application of science in the photonics industry; many transferable skills should be developed. A series of lectures will be given by industrial scientists in different topic areas. A section on innovation and team work will look at how ideas are born, nurtured, and engineered into a final product. Business awareness will include material on intellectual property rights, business formation, and leadership skills. This module also includes a literature review related to the topic of the industrial project. Students also practise their communication skills by presenting work on paper and orally to members of the industrial advisory committee, staff and fellow students.

Class Hour: To be arranged.

Teaching: Lectures, workshops and guided study.

Assessment: Continuous Assessment = 100%

PH5176 Laboratory

Credits: 36.0  
Semester: Whole Year  
Programme(s): Compulsory module for Photonics and Optoelectronic Devices Postgraduate Taught Programme.

Description: The teaching laboratory allows students to explore concepts in photonics in a practical setting. It also develops skills in instrumentation, experimental design, and problem solving. Many of the experiments are “open-ended”, which encourages further independent thinking. Experiments include diode pumped lasers, resonator design, optical parametric oscillator, modulators, spectroscopy, mobility measurements, optical communications and optical amplifiers.

Class Hour: To be arranged.

Teaching: Three 3-and-a-half-hour sessions per week.

Assessment: Continuous Assessment = 100%

PH5177 Research project

Credits: 36.0  
Semester: Summer  
Programme(s): Compulsory module for Photonics and Optoelectronic Devices Postgraduate Taught Programme.

Description: All M.Sc. students carry out a 3-month research project, in most cases carried out at a U.K. company. Part-time students who are industry employees may carry out the project at their own company. Students will have completed a literature survey prior to the project, and write a dissertation on the project which is assessed in September.

Class Hour: Placement

Assessment: Dissertation, Continuous Assessment & Oral Examination= 100%

PH5201 Lasers

Credits: 20.0  
Semester: 1  
Programme(s): Compulsory module for Engineering Doctorate in Photonics Postgraduate Taught Programme.

Description: This module presents a description of the main physical concepts upon which an understanding of laser materials, operations, and applications can be based. These concepts include a semi-classical treatment of light-matter interaction, gain, absorption and refractive index, rate-equation theory of lasers, gain and its saturation, frequency selection and tuning in lasers, transient phenomena, and resonator and beam optics.

Class Hour: To be arranged.

Teaching: 5 one-hour lectures per week (50 lectures in total) plus some tutorials.

Assessment: Three Hour Examination = 100%
PH5202 Modern Optics
Credits: 15.0 Semester: 1
Programme(s): Compulsory module for Engineering Doctorate in Photonics Postgraduate Taught Programme.
Description: The nonlinear optics section of this module describes the physical ideas and application of second and third order nonlinear optics, including phenomena such as harmonic generation, parametric gain, saturated absorption, nonlinear refraction, Raman scattering, and optical solitons. The modulator section looks at the electro-optic and acousto-optic effects and their use in optical modulators. The section on photonic guiding explains how micro-structuring of materials can lead to designer light guides and emitters.
Class Hour: To be arranged.
Teaching: 3 one-hour lectures per week (27 lectures in total) plus some tutorials.
Assessment: Two Hour Examination = 100%

PH5203 Terahertz Technology
Credits: 5.0 Semester: 1
Programme: Optional module for Engineering Doctorate in Photonics Postgraduate Taught Programme
Description: This course covers the sources and techniques used in the generation, propagation, and detection of electromagnetic waves of Terahertz frequency. Laser-based techniques at the high frequency end and Gunn diodes at the lower frequency end are both covered.
Class Hour: To be arranged
Teaching: 2 one-hour lectures per week (12 lectures in total)
Assessment: Written examination

PH5204 Technical Communication and Optoelectronics in Industry
Credits: 15.0 Semester: 1
Programme(s): Compulsory module for Engineering Doctorate in Photonics Postgraduate Taught Programme.
Description: This module aims to develop students' skills in technical communication and their understanding of the place of photonics in industry. It does this by a combination of exercises involving literature surveys and report writing, including a dissertation on the topic of the student's research, and by a series of lectures given by speakers drawn from the photonics industrial sector.
Class Hour: To be arranged.
Teaching: Occasional two-hour lectures.
Assessment: Continuous Assessment = 100%

PH5205 Experimental Laboratory
Credits: 20.0 Semester: 1
Programme(s): Compulsory module for Engineering Doctorate in Photonics Postgraduate Taught Programme.
Description: The teaching laboratory allows students to explore concepts in photonics in a practical setting. It also develops skills in instrumentation, experimental design, and problem solving. Many of the experiments are "open-ended", which encourages further independent thinking. Experiments include diode pumped lasers, resonator design, optical parametric oscillator, modulators, spectroscopy, mobility measurements, optical communications and optical amplifiers.
Class Hour: To be arranged.
Teaching: Three 3.5 hour sessions per week.
Assessment: Continuous Assessment = 100%
PH5206 Innovation and Teamwork
Credits: 5.0 Semester: 1
Programme(s): Optional module for Engineering Doctorate in Photonics Postgraduate Taught Programme.
Description: This module provides an introduction to project management and teamwork, and aims to foster a greater understanding of the business context in which photonics research is conducted. It involves lectures, “practical” sessions, and team-work sessions in which a product is taken from inception to sales and servicing.
Class Hour: To be arranged.
Teaching: 2 weeks intensive course comprising 8 lectures and 12 hours of workshops.
Assessment: Continuous Assessment = 100%

PH5207 Polymers and Liquid Crystals for Displays
Credits: 5.0 Semester: 1
Programme(s): Optional module for Engineering Doctorate in Photonics Postgraduate Taught Programme.
Description: This short module introduces concepts of optoelectronic display devices, including semiconducting polymers, and the properties of liquid crystals.
Class Hour: To be arranged.
Teaching: 10 one-hour lectures in total and some tutorials
Assessment: One Hour Examination = 100%

PH5208 Semiconductor Physics and Devices
Credits: 10.0 Semester: 1
Programme(s): Compulsory module for Engineering Doctorate in Photonics Postgraduate Taught Programme.
Description: This is a distance learning module covering the basic properties of semiconductor physics including their optical and electronic properties, and the low dimensional structures which may be constructed from them; and semiconductor devices ranging from pn junctions, solar cells, and LEDs to lasers, waveguides, optical amplifiers, optical modulators, and detectors.
Teaching: Material, tutorial support, and continuous assessment delivered at a distance by means of WebCT. Students are responsible for ensuring they have internet access. The course covers material equivalent to that covered in 30 conventional lectures.
Assessment: Continuous Assessment = 40%, Two Hour Examination = 60%

PH5209 Polymers and Liquid Crystals for Displays – Distance Learning
Credits: 5.0 Semester: 1
Programme(s): Optional module for Engineering Doctorate in Photonics Postgraduate Taught Programme.
Description: This is a distance learning module covering the concepts of optoelectronic display devices, including semiconducting polymers, and the properties of liquid crystals.
Teaching: Material, tutorial support, and continuous assessment delivered at a distance by means of WebCT. Students are responsible for ensuring they have internet access. The course covers material equivalent to that covered in 12 conventional lectures.
Assessment: Continuous Assessment = 40%, Two Hour Examination = 60%

PH5301 Dissertation for MSc Programme
Credits: 60.0 Semester: Summer
Programme(s): Compulsory module for MSc Physics Postgraduate Taught Programme.
Description: This dissertation will be supervised by a member of the teaching staff who will advise on the choice of subject and provide guidance during the work. The completed dissertation of not more than 15,000 words must be submitted by the end of August.
Teaching: Weekly meetings with supervisor
Assessment: Dissertation and Oral Examination = 100%
